sinta
Science and Technology Index

Sinta is Evolving

Sinta (Science and Technology Index), delivering acces to citations and expertise in Indonesia. Web-based research information system offering fast access, easy and comprehensive to measure the performance of researchers, institutions and journals in Indonesia. Sinta provide benchmarks and analysis, identification of research strength of each institution to develop collaborative partnerships, to analyze the trend of research and expert directories.

Import Libraries

In [1]:
```
#Import the Library
import requests #requests untuk mengakses website yg akan di scrap (diambil datanya)
from bs4 import BeautifulSoup as bs4 #untuk membuat web scraping jauh lebih mudah
import seaborn as sns
import pandas as pd
import numpy as np
```

In [2]:
```
#Set Option to Expand Rows, Columns and Columns Width
pd.set_option('display.max_rows', None)
```

```
pd.set_option('display.max_columns', None)
pd.set_option('display.max_colwidth', None)
```

Specifying URL and Number of Pages

Determine which URL link and the number of pages for which the data retrieval process will be carried out.

In [3]:
```
url_base = "https://sinta.kemdikbud.go.id/journals/index/?page="  # Base URL for scraping
pages_numbers = list(range(1,46))  # Specify the total number of pages to scrape

print(f'Data Extracted from Page {min(pages_numbers)} to {max(pages_numbers)}')
print(' ')
print(f'Official SINTA Journal URL = {url_base[0:38]}')
```

```
Data Extracted from Page 1 to 45

Official SINTA Journal URL = https://sinta.kemdikbud.go.id/journals
```

Data Retrieval Process

Data Objective :
Provides information related to the latest Journals and a list of other Journals that can be used for research literature such as Thesis, Thesis or Dissertation.

What data will be retrieved?

1. **Journal Title :** Existing Journal titles are listed at https://sinta.kemdikbud.go.id/
2. **Impact :** Assessment standards used to measure the quality of journal publications based on the number of citations
3. **H5-Index :** The largest h number for which h articles published (**in the last 5 years**)
4. **Citations (Last 5 Year) :** Number of Citations in a Journal in the last 5 Years
5. **Citations :** Overall Number of Citations in a Journal
6. **Journal Publisher :** Parties that publish journals
7. **Journal Subject :** Journal Subject on SINTA (Science and Technology Index) refers to the scientific field or discipline on which the scientific journal focuses.

8. **P-ISSN Number :** A unique number assigned to serialized or periodical publications in print format
9. **E-ISSN Number :** A unique number assigned to serialized or periodical publications in electronic format
10. **Accreditation Levels :** A level that describes the quality of scientific journals which is divided into 6 levels from highest to lowest from SINTA 1 (S1) to SINTA 6 (S6).

1. Retrieved Journal Title

In [4]:
```
#extracted journal title
def scrap_links(url_base, pages_numbers):
    journal_title = []

    index = 0
    while index < len(pages_numbers):
        url = f"{url_base}{pages_numbers[index]}"

        #mengambil data (web scraping) dari journal sinta
        journal_page = requests.get(url).text

        #Mencari Judul Jurnal
        journal_soup = bs4(journal_page,"lxml")
        journal_title_soup = journal_soup.find_all('div', {'class':'affil-name mb-3'})

        for i in range(len(journal_title_soup)):
            a_tag = journal_title_soup[i].find('a')
            if a_tag:
                journal_title.append(a_tag.text)
        index += 1

    # Remove the unwanted spaces and '\n'
    journal_title = [journal.strip() for journal in journal_title]
    journal_title = ['No Information' if x == '' or pd.isna(x) else x for x in journal_title]
    journal_title.append(journal_title)

    #return journal_title
    return journal_title

journal_title = scrap_links(url_base, pages_numbers)
journal_title = journal_title[:-1]
print(f'Journal Title Total Data Extracted : {len(journal_title)}')
print(' ')
```

```
print(f'The 5 First Rows Data (Journal Title) :\n{journal_title[0:6]}')
```

```
Journal Title Total Data Extracted : 450

The 5 First Rows Data (Journal Title) :
['International Journal on Advanced Science, Engineering and Information Technology (IJASEIT)', 'Ahkam: Jurnal Ilmu S
yariah', 'Indonesian Journal of Science and Technology', 'Asean Journal of Science and Engineering (AJSE)', 'Makara J
ournal of Science', 'Bestuur']
```

2. Retrieve Journal Impact Factor

Impact Factor or IF is an assessment standard made by The Institute of Scientific Information (ISI) which is used to measure the quality of journal publications based on the number of citations within a certain period of time, usually 2 years. In simple terms, IF is a form of assessment used to determine how much impact a lecturer's publication has in the academic world and in various fields of life.

IF refers to the result or number of citations, which is a lecturer's publication used as a reference or reference. The more that make the lecturer's publication as a reference, the IF score obtained is also maximized.

In [5]:
```
#extracted impact value
def scrap_links(url_base, pages_numbers):
    impact_value = []

    index = 0
    while index < len(pages_numbers):
        url = f"{url_base}{pages_numbers[index]}"

        #mengambil data (web scraping) dari journal sinta
        journal_page = requests.get(url).text

        #Mencari Impact Jurnal
        impact_soup = bs4(journal_page,"lxml")
        journal_impact_soup = impact_soup.find_all('div',{'class':'stat-profile journal-list-stat mt-3'})

        # Loop through each element in journal_impact_soup
        div_impact = []
        for journal in journal_impact_soup:
            # Find all div elements with the specific class inside the current journal
            impact_divs = journal.find_all('div', class_='col-4 col-lg col-sm-4 col-md-4')

            # Loop through these divs and check for the word 'Impact'
            for div in impact_divs:
```

```
                if 'Impact' in div.get_text():
                    div_impact.append(div.prettify())  # Print the matched div with "Impact"

        # Loop through each HTML string in the list
        for html in div_impact:
            # Parse the HTML
            soup = bs4(html, "lxml")

            # Find the div with class 'pr-num'
            pr_num_div = soup.find('div', class_='pr-num')

            # Get the text, stripping any extra whitespace
            if pr_num_div:
                impact_value.append(pr_num_div.get_text(strip=True))  # Extract and strip whitespace

        index += 1

    #make it impact value properly!
    impact_value = [float(items.replace(',','.')) for items in impact_value]
    impact_value = [0 if np.isnan(x) else x for x in impact_value]

    #return impact value
    return impact_value

impact_value = scrap_links(url_base, pages_numbers)
print(f'Impact Total Data Extracted : {len(impact_value)}')
print(' ')
print(f'The 5 First Rows Data (Impact ) :\n{impact_value[0:6]}')
```

```
Impact Total Data Extracted : 450

The 5 First Rows Data (Impact ) :
[65.0, 37.0, 22.8, 21.31, 16.0, 14.38]
```

3. Retrieved Journal H5-Index Value

The **H5 index** is created by Google Scholar and is similar to the h index described in Author Level Metrics.

The H5 index is the largest h number for which h articles published (**in the last 5 years**) have at least h citations each. So, an H5 index of 60 means that the journal has published 60 articles in the previous 5 years that have 60 or more citations each.

In [6]:
```
#extracted h5-index value
def scrap_links(url_base, pages_numbers):
```

```
h5_index_value = []

index = 0
while index < len(pages_numbers):
    url = f"{url_base}{pages_numbers[index]}"

    #mengambil data (web scraping) dari journal sinta
    journal_page = requests.get(url).text

    #Mencari H-5 Index Jurnal
    h5_index_soup = bs4(journal_page,"lxml")
    journal_h5_index_soup = h5_index_soup.find_all('div',{'class':'stat-profile journal-list-stat mt-3'})

    # Loop through each element in journal_h5_index_soup
    div_h5_index = []
    for journal in journal_h5_index_soup:
        # Find all div elements with the specific class inside the current journal
        h5_index_divs = journal.find_all('div', class_='col-4 col-lg col-sm-4 col-md-4')

    # Loop through these divs and check for the word 'h5_index'
        for div in h5_index_divs:
            if 'H5-index' in div.get_text():
                div_h5_index.append(div.prettify())  # Print the matched div with "h5_index"

    # Loop through each HTML string in the list
    for html in div_h5_index:
        # Parse the HTML
        soup = bs4(html, "lxml")

        # Find the div with class 'pr-num'
        pr_num_div = soup.find('div', class_='pr-num')

        # Get the text, stripping any extra whitespace
        if pr_num_div:
            h5_index_value.append(pr_num_div.get_text(strip=True))  # Extract and strip whitespace

    index += 1

#make it H5 Index Value properly!
h5_index_value = [str(items) for items in h5_index_value]
h5_index_value = ['No Information' if x == '' or pd.isna(x) else x for x in h5_index_value]
```

```
    #return H5 Index Value
    return h5_index_value

h5_index_value = scrap_links(url_base, pages_numbers)
print(f'H5 Index Total Data Extracted : {len(h5_index_value)}')
print(' ')
print(f'The 5 First Rows Data (H-5 Index) :\n{h5_index_value[0:6]}')
```

```
H5 Index Total Data Extracted : 450

The 5 First Rows Data (H-5 Index) :
['47', '31', '38', '14', '21', '27']
```

4. Retrieved Total Citations in Last 5 Year in each Journal

Number of citations over the last 5 years. If the current year is 2024, then the total citations will be summed up from the previous 5 years (2019).

In [7]:
```
#extracted total citations in last 5 year
def scrap_links(url_base, pages_numbers):
    citations_5yr_value = []

    index = 0
    while index < len(pages_numbers):
        url = f"{url_base}{pages_numbers[index]}"

        #mengambil data (web scraping) dari journal sinta
        journal_page = requests.get(url).text

        #Mencari Citations 5yr Jurnal
        citations_5yr_soup = bs4(journal_page,"lxml")
        journal_citations_5yr_soup = citations_5yr_soup.find_all('div',{'class':'stat-profile journal-list-stat mt-3'

        # Loop through each element in journal_citations_5yr_soup
        div_citations_5yr = []
        for journal in journal_citations_5yr_soup:
            # Find all div elements with the specific class inside the current journal
            citations_5yr_divs = journal.find_all('div', class_='col-4 col-lg col-sm-4 col-md-4')

            # Loop through these divs and check for the word 'citations_5yr'
            for div in citations_5yr_divs:
                if 'Citations 5yr' in div.get_text():
```

```
                    div_citations_5yr.append(div.prettify())  # Print the matched div with "citations_5yr"

        # Loop through each HTML string in the list
        for html in div_citations_5yr:
            # Parse the HTML
            soup = bs4(html, "lxml")

            # Find the div with class 'pr-num'
            pr_num_div = soup.find('div', class_='pr-num')

            # Get the text, stripping any extra whitespace
            if pr_num_div:
                citations_5yr_value.append(pr_num_div.get_text(strip=True))  # Extract and strip whitespace

        index += 1

    #make it Citations (Last 5 Years) Properly!
    citations_5yr_value = [int(items.replace('.','')) for items in citations_5yr_value]
    citations_5yr_value = [0 if np.isnan(x) else x for x in citations_5yr_value]

    #return Citations (Last 5 Years)
    return citations_5yr_value

citations_5yr_value = scrap_links(url_base, pages_numbers)
print(f'Citations (Last 5 Year) Total Data Extracted : {len(citations_5yr_value)}')
print(' ')
print(f'The 5 First Rows Data of Citations (Last 5 Year) :\n{citations_5yr_value[0:6]}')
```

```
Citations (Last 5 Year) Total Data Extracted : 450

The 5 First Rows Data of Citations (Last 5 Year) :
[13752, 3788, 7077, 1325, 2246, 1791]
```

5. Retrieved Total Citations (All)

Total number of citations in journal since journal was published

In [8]:
```
#extract overall total citations
def scrap_links(url_base, pages_numbers):
    citations_value = []

    index = 0
    while index < len(pages_numbers):
```

```
        url = f"{url_base}{pages_numbers[index]}"

        #mengambil data (web scraping) dari journal sinta
        journal_page = requests.get(url).text

print(' ')
```

```
print(f'The 5 First Rows Data (Citations) :\n{citations_value[0:6]}')
```

```
Citations Total Data Extracted : 450

The 5 First Rows Data (Citations) :
[17547, 4241, 7285, 1329, 3630, 1802]
```

6. Retrieved Journal Publisher

A journal publisher is an institution or organization responsible for managing, producing, and publishing scientific journals or periodical publications. Journal publishers play an important role in supporting the scientific communication process by facilitating the dissemination of research results through regular publications.

Publishers can be universities, research institutes, professional associations, non-profit organizations, or commercial companies.

In [9]:
```
#extract journal publisher
def scrap_links(url_base, pages_numbers):
    penerbit_value = []

    index = 0
    while index < len(pages_numbers):
        url = f"{url_base}{pages_numbers[index]}"

        #mengambil data (web scraping) dari journal sinta
        journal_page = requests.get(url).text

        # Menemukan Penerbit Jurnal
        penerbit_soup = bs4(journal_page,'lxml')
        journal_penerbit_soup = penerbit_soup.find_all('div',{'class':'affil-loc mt-2'})

        #Loop through journal_penerbit_soup
        div_penerbit = []
        for items in journal_penerbit_soup:
            div_penerbit.append(str(items.find('a')))

        # Loop through each div tag
        for div in div_penerbit:
            # Find the position of </i> and </a>
            start = div.find('</i>')  # Position of </i>
            end = div.find('</a>')    # Position of </a>

            # Check if both tags are found
            if start != -1 and end != -1:
```

```
                # Extract the text between </i> and </a>
                extracted_text = div[start+4:end].strip()  # Add 4 to skip the </i> tag

                # Print the extracted text
                penerbit_value.append(extracted_text)

        index += 1
    #make penerbit value properly
    penerbit_value = ['No Information' if x == '' or pd.isna(x) else x for x in penerbit_value]

    #return penerbit (publisher)
    return penerbit_value

penerbit_value = scrap_links(url_base, pages_numbers)
print(f'Penerbit Total Data Extracted : {len(penerbit_value)}')

The 5 First Rows Data (Penerbit) :
['Indonesian Society for Knowledge and Human Development (Insight)', 'Universitas Islam Negeri Syarif Hidayatullah Ja
karta', 'Universitas Pendidikan Indonesia', 'Universitas Pendidikan Indonesia', 'Universitas Indonesia', 'Universitas
Sebelas Maret']
```

7. Retrieved Journal Subject

Journal Subject on SINTA (Science and Technology Index) refers to the scientific field or discipline on which the scientific journal focuses.

SINTA classifies the listed journals based on the subject or main topic of the articles published in them. With the Journal Subject category, SINTA makes it easier for researchers, lecturers, and readers to find journals that are relevant to their field of research or interest.

In [10]:
```
#extract Journal Subject
def scrap_links(url_base, pages_numbers):
    subject_value = []

    index = 0
    while index < len(pages_numbers):
        url = f"{url_base}{pages_numbers[index]}"
```

```
        #mengambil data (web scraping) dari journal sinta
        journal_page = requests.get(url).text

        # Menemukan Subject Area Jurnal
        subject_soup = bs4(journal_page,'lxml')
        journal_subject_soup = subject_soup.find_all('div',{'class':'profile-id'})

        for i in range(len(journal_subject_soup)):
            subject_value.append(journal_subject_soup[i].get_text()[258:])
        index += 1

    #make subject properly!
    subject_value = [items.strip() for items in subject_value]
    subject_value = [items.replace('Subject Area : ','') for items in subject_value]
    subject_value = ['No Information' if x == '' or pd.isna(x) else x for x in subject_value]

    #return subject value
    return subject_value

subject_value = scrap_links(url_base, pages_numbers)

print(f'Subject Total Data Extracted : {len(subject_value)}')
print(' ')
print(f'The 5 First Rows Data (Subject) :\n{subject_value[0:6]}')
```

Subject Total Data Extracted : 450

The 5 First Rows Data (Subject) :
['Science', 'Social, Religion', 'Science, Social', 'Science, Agriculture, Engineering', 'Science', 'No Information']
```

8. Retrieved Journal P-ISSN Number

P-ISSN (Print International Standard Serial Number) is a unique number assigned to serialized or periodical publications in print format, such as journals, magazines, newspapers, or other regularly published publications. This ISSN serves as the official identity of a publication, similar to the ISBN on books.

In [11]:
```
#extract P-ISSN Number
def scrap_links(url_base, pages_numbers):
    p_issn_value = []

    index = 0
    while index < len(pages_numbers):
```

```
        url = f"{url_base}{pages_numbers[index]}"

        #mengambil data (web scraping) dari journal sinta
        journal_page = requests.get(url).text

        # Menemukan P-ISSN Jurnal (maks. 8 digit)
        p_issn_soup = bs4(journal_page,'lxml')
        journal_p_issn_soup = p_issn_soup.find_all('div',{'class':'profile-id'})

        for i in range(len(journal_p_issn_soup)):
            p_issn_value.append(journal_p_issn_soup[i].get_text()[56:65])

        index += 1

    #make P-ISSN properly!
    p_issn_value = [items.strip() for items in p_issn_value]
    p_issn_value = [items.replace(' ','') for items in p_issn_value]
    p_issn_value = [items.replace('|','') for items in p_issn_value]
    p_issn_value = ['No P-ISSN Number' if x == '0' or pd.isna(x) else x for x in p_issn_value]
    p_issn_value = ['No P-ISSN Number' if x == '' or pd.isna(x) else x for x in p_issn_value]

    #Return P-ISSN value
    return p_issn_value

p_issn_value = scrap_links(url_base, pages_numbers)

print(f'P-ISSN Total Data Extracted : {len(p_issn_value)}')
print(' ')
print(f'The 5 First Rows Data (P-ISSN) :\n{p_issn_value[0:6]}')
```

```
P-ISSN Total Data Extracted : 450

The 5 First Rows Data (P-ISSN) :
['No P-ISSN Number', '14124734', '25278045', '27766098', '23391995', '23023783']
```

9. Retrieved Journal E-ISSN Number

E-ISSN (Electronic International Standard Serial Number) is a unique number assigned to serialized or periodical publications in electronic or digital format, such as electronic journals, digital magazines, or scholarly publications published online.
Just like the P-ISSN for the printed version, the E-ISSN serves as the official identity for the electronic version of the publication.

In [12]:
```
def scrap_links(url_base, pages_numbers):
```

```
    e_issn_value = []

    index = 0
    while index < len(pages_numbers):
        url = f"{url_base}{pages_numbers[index]}"

        #mengambil data (web scraping) dari journal sinta
        journal_page = requests.get(url).text

        # Menemukan E-ISSN Jurnal (maks. 8 digit)
        e_issn_soup = bs4(journal_page,'lxml')
        journal_e_issn_soup = e_issn_soup.find_all('div',{'class':'profile-id'})

        for i in range(len(journal_e_issn_soup)):
            e_issn_value.append(journal_e_issn_soup[i].get_text()[113:130])

        index += 1

    #make E-ISSN properly!
    e_issn_value = [items.strip() for items in e_issn_value]
    e_issn_value = [items.replace(' ','') for items in e_issn_value]

print(f'The 5 First Rows Data (E-ISSN) :\n{e_issn_value[0:6]}')
```

```
E-ISSN Total Data Extracted : 450

The 5 First Rows Data (E-ISSN) :
['24606952', '24078646', '25278045', '27765938', '23560851', '27224708']
```

10. Retrieved Accreditation Levels

Accreditation assessment of scientific journals in Indonesia is conducted periodically by the **Ministry of Research, Technology and Higher Education** (**Kemenristekdikti**) through the **Directorate General of Research and Development**.

This process aims to assess the quality of the journal and determine its accreditation level, both in SINTA (Science and Technology Index) and in other institutions.

In [13]:
```
#extract Accreditation Levels
def scrap_links(url_base, pages_numbers):
    accredited_value = []

    index = 0
    while index < len(pages_numbers):
        url = f"{url_base}{pages_numbers[index]}"

        #mengambil data (web scraping) dari journal sinta
        journal_page = requests.get(url).text

        # Menemukan Accredited Jurnal
        accredited_soup = bs4(journal_page,'lxml')
        journal_accredited_soup = accredited_soup.find_all('div' > 'span',{'class':'stat-prev mt-2'})

        for i in range(len(journal_accredited_soup)):
            accredited_value.append(journal_accredited_soup[i].get_text()[2:4])

        index += 1

    #make accredited properly
    accredited_value = ['Not Accredited' if x == 'NA' or pd.isna(x) else x for x in accredited_value]

    #return accredited value
    return accredited_value

accredited_value = scrap_links(url_base, pages_numbers)
print(f'Accredited Score Total Data Extracted : {len(accredited_value)}')
print(' ')
print(f'The 5 First Rows Data (Accredited Score) :\n{accredited_value[0:6]}')
```

```
Accredited Score Total Data Extracted : 450

The 5 First Rows Data (Accredited Score) :
['S1', 'S1', 'S1', 'S1', 'S1', 'S1']
```

11. Create Summary Total Data Retrieved in each Data

In [14]:
```
#Create Summary Total Data Extracted in Each Columns
print('Summary Total Data Extracted in Each Columns :')
print(' ')
print(f'1. Journal Title ---> {len(journal_title)} Data Extracted')
print(f'2. Publisher (Penerbit) ---> {len(penerbit_value)} Data Extracted')
print(f'3. Subject ---> {len(subject_value)} Data Extracted')
print(f'4. P-ISSN Number ---> {len(p_issn_value)} Data Extracted')
print(f'5. E-ISSN Number ---> {len(e_issn_value)} Data Extracted')
print(f'6. Accreditations Level ---> {len(accredited_value)} Data Extracted')
print(f'7. Impact Score ---> {len(impact_value)} Data Extracted')
print(f'8. H5 Index ---> {len(h5_index_value)} Data Extracted')
print(f'9. Total Citations (Last 5 Year) ---> {len(citations_5yr_value)} Data Extracted')
print(f'10. Total Citations ---> {len(accredited_value)} Data Extracted')
```

```
Summary Total Data Extracted in Each Columns :

1. Journal Title ---> 450 Data Extracted
2. Publisher (Penerbit) ---> 450 Data Extracted
3. Subject ---> 450 Data Extracted
4. P-ISSN Number ---> 450 Data Extracted
5. E-ISSN Number ---> 450 Data Extracted
6. Accreditations Level ---> 450 Data Extracted
7. Impact Score ---> 450 Data Extracted
8. H5 Index ---> 450 Data Extracted
9. Total Citations (Last 5 Year) ---> 450 Data Extracted
10. Total Citations ---> 450 Data Extracted
```

Create the Dataframe

In [15]:
```
# Create the Dataframe
sinta_journal_df = pd.DataFrame(zip(journal_title,
                                    penerbit_value,
